Workspace: demo

1. Settings
2. Connectors
 2. 1 My first connector
3. Environment Variables
4. Forms
5. Open Telemetry
6. Gateway

Settings

General Settings

In this section, you will find details about the configuration of the container and the upload options for Git. Below is information about the name of the container image, the form page port, the container timeout time, and the configuration data of the Git repository where the image can be stored.

Container Image Name	Form Page Port	Container Timeout (minutes)
demo	8000	10

Upload to Git

Repo URL: <https://github.com/wagneroficial/qap-stg.git>

Upload to Git	Username	Email
true	wagneroficial	No value

Connectors

1. My first connector

Port: 8880

Mapping:

This mapping defines the correspondence of connector variables according to the SCIM protocol to ensure that group attributes in different data sources are correctly translated into SCIM equivalents, facilitating interoperability between identity management systems.

Group mapping

Source	Destination	Type
id	id	undefined
displayName	displayName	undefined
member	members.value	undefined

User mapping

Source	Destination	Type
id	id	undefined
username	userName	undefined
active	active	undefined

givenName	name.givenName	undefined
familyName	name.familyName	undefined
displayName	name.formatted	undefined
email	emails.work.value	undefined
telephoneNumber	phoneNumbers.work.value	undefined
postalCode	addresses.work.postalCode	undefined
streetAddress	addresses.work.streetAddress	undefined

Interceptors:

Create business rules or fetch data before reaching the connector.

Type: business-rule

Description: Define customized business rules to intercept and control requests.

Condition type:all

Condition table

Condition	Field	Type	Value
notEqual	userName	string	admin
notEqual	userName	string	root

Forms

1 - My first form

Details:

- Method:
- Path: /users

Selected Connectors:

- 681df03d09b51935c9c22a29

Environment Variables

Name	Value
USERNAME	a****
PASSWORD	a****

Open Telemetry

Disabled

Integration with Open Telemetry enables the collection of detailed metrics and tracking of operations carried out by the connector. This includes monitoring requests to user and group endpoints, providing visibility into system performance and behavior. Using methods such as GET, POST, PUT, PATCH and DELETE, operations are tracked and sent to the configured endpoint

URL: `http://localhost:9411/api/v2/spans`

Name	Methods	Path
QSCIM Tracing	GET, POST, PUT, PATCH, DELETE	users, groups

Gateway Disabled

The gateway integrates and facilitates communication between different systems using the SCIM protocol. It connects several connectors, allowing synchronization and efficient management of identities and access in distributed environments.

Enabled	Connectors	Port
false	0	5000
